E2-QZ: the 100 endpoint images of a Hunyuan + Qwen loop with Chinese instructions

Each image is step 99 of 100 for one trajectory; one trajectory per cell, numbered by seed. Same 100 seed prompts and loop as A0-core, with the generator, captioner and language swapped: generator HunyuanDiT v1.2 (fp16, 25 steps, 512 px); captioner qwen2.5vl:7b (Q4_K_M) via Ollama, given Hintze's caption instruction translated into Chinese. Convergence survives the swap; the attractors change (pagoda by a misty lake, moon bridge, lake boats).

Run e2_qz, 2026-10-22/23, 10,000 trajectory-steps on one RTX PRO 6000. Brad Hinkel, github.com/bradhinkel/ai_to_ai_loops (reports/e2_qz.md). Reference: Hintze, AI-to-AI loops, OSF WGDQ4.
